Writing a Conclusion

3 Parts to All Conclusions

1.) Answer the purpose (and hypothesis if included).

2.) Accuracy → were your results **consistent** if you did multiple trials, or if you didn't, then compare your results with at least 3 other groups (5 is better) and see if your results agree or not.

3.) How can your lab be improved, NOT YOUR RESULTS, but the LABS! Or what experiment or idea should be next now that you found your results.
