

## Review - Mechanisms of Evolution

**Which mechanism of evolution is represented by the following examples?**

A male peacock displays his feathers to win over a female

A deer migrates from Knox mountain and joins a different population of deer that live on Dilworth mountain

Male moose use their large antlers to fight over females

An increase in rain turned a dry forest green. In response beetles changed from a brown colour to green.

A change in the genes of a bird caused it to develop a more favorable beak shape

A plague results in the death of 90% of the population, leaving only 10% to repopulate their town

Jimmy brings his pet parrots on vacation with him but they make friends on this new island and leave Jimmy to go home all alone
